

We firmly believe that the development of industrial technology is endless, and there is no end to quality and customer service.

To achieve the ideal and pursuit of perfection, UKS never stops.

As long as the world is making progress, you can see that UKS is diligent and dedicated.

Janne vicose industrial 2005

Leading the way in Technology & Quality

JANNE VICOSE Industrial Co., Ltd., was invested in the mainland of China in 2005, with industrial area of 12,300 square meters,

and construction area of 6,200 factories and office buildings.

The environment of the area with green area more than 48 and attractive landscapes is pretty elegant, and vigorous.

JANNE VICOSE is an enterprise by production and trade of professional rubber seals, automobile and motorcycle parts and accessories hydraulic transmission parts. Among its production, the brands of UKS seal series are well-known.

They are widely used in mining,

machinery manufacturing and other industries JANNE VICOSE provides accessories many years to major companies for several years, and, therefore,

has been greatly trusted by numerous mechanical equipment manufacturing and automobile manufacturing enterprises. www. uksoilseals. com

BRIEF INTRODUCTION ABOUT UKS

INTRDUCTION

Industrial Co., Ltd. Of JANNE VICOSE was invested in the mainland of China in 2005, with industrial area of 12,300 square meters, and construction area of 6,200 factories and office buildings. The environment of the area with green area more than 48 and attractive landscapes is pretty elegant, and vigorous.

JANNE VICOSE is an enterprise by production and trade of professional rubber seals, automobile and motorcycle parts and accessories hydraulic transmission parts. Among its production, the brands of UKS seal series are well-known. They are widely used in mining, machinery manufacturing and other industries. JANNE VICOSE provides accessories many years to major companies for several years, and, therefore, has been greatly trusted by numerous mechanical equipment manufacturing and automobile manufacturing enterprises.

ADVANTAGE

We have:

1.science researcher	25%
2.niccety equipments	>33%
3.experiment equipments	>12%
4.new product development(year)	>13.7%

PR-CATEGO RY

Oil sealing, bushings, o-ring&o-ring kits, D-, U-, V-, X-ring, engine gasket, rubber rroduct, valve stem seals, mechanical seals, heavy duty seals, and drill using, spool-using, buffer ring, dustproof, wear resistant ring et.

TECHNOLOGY

JANNE VICOSE has an excellent high-quality technology development team, who uses the most advanced computer software, and precisely plan and design every product. Our Company has openly professional enterprise laboratory, which is equipped with kinds of detection equipments and testing materials. They ensure the best technology to quality products; The technical engineering staff of the UKS devotes themselves to the need of each end customer, and adheres to professional standards being a technical staff.

DEVELOPMENT

DESIGN

OUTLOOK

Perfect service to customers is of vital importance to any business; staff's service is the driving force for development. In the 21st century, JANNE VICOSE maintained the nature of the modern international enterprises in manufacturing and service; adhere to provide the most comprehensive services to each customer. We are looking forward to working with China and the world countries and the regions to conduct a comprehensive cooperation and common development.

Overview of the seal rings of rotating shafts:

Commonly known as, oil seal, it is an indispensable seal product in the lubricating transmission system, which is widely used in industry and mining, chemical industry, water and power system, industrial machinery manufacturing, sea, air, shipping and national defense. It is mainly used to prevent the leakage of oil from shafting and oil sealing boxes, and prevent the erosion pollution of dust, water, or dirt, which relatively affects the common utilization of mechanical equipment, to extend the service life of the equipment. Over the past 30 years, the usage of oil seals has developed rapidly. Through the application of practice, original leather products have been developed for the application of diversified materials. Furthermore, the design has made innovative technological improvements, which makes the application of Oil Seal more extensive and effective. As the development of science and technology is accelerated, specialists in the field of science and technology have been updating the shapes and technical content of oil seals, in response to the escalating quality demands from the designers in industrial manufacturing.

Technical characteristics of the seal rings of rotating shafts

- 1. Scientific structure, being verified by decades of practice; 2. small wheelbase, good sealing performance;
- 3. various materials and types, a wide range of applications, strong applicability; 4. simple structure, convenient loading, and unloading

Implementation standard DIN 3760-1996 & UNI ISO 6194/1-1990

The machining and requirements of shaft and cavity machining requirements

item Position	surface hardness	tolerance error	chamfering scale	chamfering	Description
drive shaft	HRC45~HRC55	h11	≥ 1mm	15~20°	See below *1 *2 *3
cavity hole	suggestion HRC45	H8	≥ 1mm	15~45°	

* 1. For the shaft with high-speed rotation, its surface hardness should be equal to or even higher than the standard of HRC55.

* 2. More attention should be paid to avoid leaving spiral traces during the processing of the surface of the shafts, to prevent reverse pumping, resulting in the loss of seal.
* 2. If the shaft had via an and a family and a f

* 3. If the shaft body is made of copper or manganese, hard chromium plating is recommended.

Note: Carbon steel is recommended for shaft material, and ductile iron should be selected as far as possible when cast iron material is closed. If the material of the cavity hole is carbon steel or cast iron, the rubber inner frame oil seal or rubber outer frame oil seal can be used. If the material of the cavity hole is aluminum alloy, the rubber outer frame oil seal cannot be applied directly. When the rubber outer frame oil seal is determined, please carefully select metal material whose expansion coefficient is similar to the cavity hole material, to make the frame, to ensure the firmness and safe application of the oil seal after assembly.

The coaxiality of the transmission shaft with the cavity hole

When assembling oil seals, ensure the coaxially of the transmission shaft and the cavity hole if possible. Otherwise, the eccentric lip of the oil seal will occur, resulting in high heat, thereafter causing accelerated wear and aging of the oil seal, thus shortening the service life of the oil seal. The specific requirements of coaxially between the transmission shaft and the cavity hole are as follows:

The concentricity of the transmission shaft

When the shaft and the center of rotation are not completely overlapping in the process of the transmission shaft moving, it will lead to eccentricity, especially at high-speed rotation, making the oil seal lip fail to stay close to the surface of the shaft, resulting in a gap, causing leakage. Because the performance of the seal depends on the sealing performance of the sealing lip, that is, the sealing self-tightening function. Therefore, we should ensure that the radial runout degree of the transmission shaft is controlled within a certain range. The specific requirements of the concentricity of the transmission shaft are as follows:

The performance comparison of rubber materials for traditional frame oil seal

The choice of rubber materials determines the performance of oil seal, so choosing oil seal rubber is an important premise to obtain the best performance of oil seal.

1.Nitrile butadiene rubber (NBR)

It has good oil resistance, wear resistance, aging resistance, and excellent elasticity. It is easy to control in terms of processing performance and curing system. It has become the preferred material for frame oil seal and other general sealing components.

2.Fluorine rubber (FKM)

With good physical properties, usually also has very good high temperature resistance, oil resistance, as well as HFA, HFB, HFC, HFD liquid water and chemical substances and solutions, is the ace choice of sealing components under harsh working conditions.

3. Silicone Rubber (SIL)

Silicone rubber is not as good as other rubber in some physical properties, but at low temperature, or high temperature, wears resistance. Excellent performance in compression deformation. In milk, mineral oil performance is good, so in specific working conditions, the position of silicone rubber is beyond reproach.

Surface velocity of rotating shafts and material selection of sealing component

How to choose the types and materials of the sealing components, you need to take the medium, the working pressure, the working speed, and the working temperature, etc. into account according to comprehensive consideration, which extends out the scientific consideration needed in the selection of sealing components. refer to the following chart:

The typical rubber material used for sealing components can adapt to the shaft rotation speed

The installation of traditional frame oil seals

1, the surface of the shaft must be strictly polished and cleaned, and strictly coated with clean grease or lubricating oil;

2. Rust, burr, dirt and other foreign bodies are not allowed in the cavity holes.

3, Make sure the size of the sealing component, the chamfer between the shaft and the cavity hole is reasonable;

4, Ensure avoiding the damage to the lip by sword slot, spline, screw thread, chamfer etc., when the lip is touched with the shaft and cavity hole, and there is no touching defect.

5, Sharp edges should be chamfered or chamfered.

6, when the oil seal is loaded into the seat hole, special tools should be used to push into the oil seal to avoid distortion.

Correct state of oil seal fit between cavity hole and shaft (as shown in the figure below) :

The correct installation method

The specifications and dimensions do not fit.

The oil seal deformation is caused by unilateral hammering without the unbacked plates.

Note: When installing exposed rubber frame oil seals, please apply sealant to the cavity parts to ensure excellent sealing performance.

Storage of rubber oil seal

1, The storage should not be affected by external factors, such as temperature, humidity, light, oxygen, ozone and energy radiation, and touched with the liquid medium. Because they may cause the rubber products to deform, harden, soften, flake, crack and destroy their original mechanical and physical properties.

2. The storage sites shall be dry, dust-free and well ventilated, and the temperature shall be above +15 degrees, but not above +25 degrees. Because, high temperature will reduce the physical performance, and shorten the service life. The storage temperature should not be lower than -10 degrees. Usually, lower temperatures harden rubber products. Before using rubber products that harden due to low temperature, they should be stored at a temperature of +20 degrees for a period of time, to be soft before installation.

3, The storage sites should be avoided direct sunlight, and be separated from higher ultraviolet light sources, the relative humidity should be lower than 65%, if there is a heating radiator and heat-supply pipes should be isolated, the room temperature should not exceed +25 degrees, and the stored rubber products should be kept a distance of at least 1 m between radiators and heat-supply pipes.

4. Containers, packages and packaging materials shall not contain components that destroy rubber products, such as copper, copper alloys, gasoline, oil or other such articles. Films containing plasticizers should not be used to package rubber products.

5, it should be noted that the stored rubber products should be in a state of no force, that is, no stretching, no compression, no deformation, otherwise it will aggravate the compression deformation of rubber products and the formation of cracks.

6, The warehouse storage time should be as short as possible. As far as long-term storage is concerned, the first storage and the second storage should be stored separately to achieve the principle of "first in first use".

Comparison and selection of common oil seal materials

Due to the influence of oil seal materials and the usage environment, their sealing effectiveness and performance are affected by various factors. Here we will discuss the various tolerance abilities of oil seals in Table I, Table II, Table III, and Table IV. This provides more options for users to choose from and scientifically deal with complex situations of machinery. When using oil seals, the environment should be fully considered to make the machinery operate better and more sustainably with the theoretical functions of the oil seals.

Table I: Choosing the usage environment of oil seals based on rubber characteristics and selecting the appropriate oil seal material for different environments is a key consideration for technical researchers. This directly affects the sealing effectiveness and lifespan of oil seals. Rubber characteristics can also predict the tolerance ability of an oil seal and replacement period.

Let time prove that choosing our products and services is the right decision.

The work of all UKS employees will make you clearly feel that time and wealth are at your fingertips.

We firmly believe that UKS's reputation is not the accumulation of numbers, but the word of mouth from numerous global customers.

Table II:

The environmental conditions in which oil seals are used vary greatly depending on the different parts of usage, including chemical media such as acids, halogens, alcohols, salts, etc. Different media have different requirements for oil seal materials. In view of customers' requirements during the selection process, the performance of various rubber materials in various chemical media is listed below to prevent errors in the selection of sealing parts due to the lack of basic knowledge.

Table Ⅲ:

Oil seal is the mechanical parts used to seal oil, so the most important indicator of oil seal is oil resistance, and this table is for different rubber materials in various types of oil resistance.By the ability to make detailed test results and analysis, as well as the reaction in the relevant liquid, it is expected that the use of units in the selection process, do not go excess bay road, the correct selection of the appropriate material, so that the oil seal and equipment can play a good performance.

Table 5: Various possible analysis of oil seal failure or damage

Other factors that affect the service life of oil seals:

1. Because the machine and equipment are not used for a long time, the service life of the oil seal is shortened.

2. During the storage and transportation of the oil seal, the life of the oil seal is shortened in advance due to the influence of ultraviolet radiation or ozone for a long time.

3. In the medium sealed by the oil seal, the properties of the oil are changed due to the addition of liquid from other media, thereby shortening the service life in advance.

4. In addition, because the machine shaft speed is too high, there is no reasonable selection when selecting the oil seal, resulting in seal failure.

5. In practical application, we also find , for example: the two sides of the oil seal are different media, one side is water, one side is oil, etc., resulting in improper material selection, resulting in oil seal failure.

6. Low temperature oil seals are used in high temperature environments, resulting in the low life of oil seals.

7. When the oil seal is used in the environment of reciprocating operation, it will also cause the oil seal failure or short service life.

8, long-term combination of a large number of dust and grease, will also shorten the life of the oil seal

Please maintain and maintain in time to ensure that the sealing components can work under normal conditions.
Please select high quality UKS seals and purchase genuine seals from JANNE VICOSE's designated franchised distributor.

Seal Professional Partner

Some thoughts affecting the use of happy life of oil seal itself:

1. Design Philosophy

The structure of an oil seal is a systematic engineering challenge, that is, different engineering conditions necessitate diverse design responses. Established oil seal companies have developed distinct and unique sealing design theories through years of experience, enabling comprehensive application throughout the lifecycle of the seal.

2. Materials science

High-quality materials represent technological breakthroughs that can solve complex problems and even perform miracles. For many years, materials science experts have been dedicated to discovering and expanding new and practical materials. The world's leading sealing companies continuously research unique materials to address complex issues and breakthrough material limitations.

3. Engineering Involvement

The longevity of oil seals is not only a concern for the manufacturers but also requires cooperation from the users. For instance, providing operating parameters, environmental conditions, and installation locations is crucial. Ideally, oil seal design experts should be involved from the beginning of the component design process to fully understand the functions and challenges the seals need to address.

4. Industrial Foundation

The industrial base significantly affects the application results of oil seals. Factors such as programming software, production machines, execution systems, vulcanization, and rolling equipment, and the current technological level of primary and auxiliary materials all impact the performance of the final product.

5. Quality Control Systems

A quality control system reflects a company's management level and strategic philosophy. Effective quality control and defective product detection standards directly influence the quality level of products delivered to users. Many companies adopt comprehensive quality control systems, such as the ISO series for quality, environmental, and human resources, 5S, Six Sigma, and even proprietary servers, data collection, and statistical software.

6.Technical Verification

Since oil seal materials are elastomeric, the process from three-dimensional design to product realization involves many critical factors, such as material density, production seasonality, initial interference, shrinkage rate of interference, and variations in pre- and post-spring interference. Even Periodic performance can also vary greatly. Therefore, technical verification becomes crucial given the uncertainties in installation dimensions and interference fits.

Raw materials are the quality basis of sealing elements

Raw materials are the quality basis of sealing elements:

How to choose the raw material, is key for the service life of the sealing elements.

This reflects the value orientation of an enterprise, different market settings. With different demands for quality, UKS has been pursuing high quality and high standard, strictly checking, globally broadening unlimited vision, seeking noble quality as the primary purpose in the selection of raw materials. Those make the high standard level of UKS brand.

Material technology development and unlimited possibilities application expansion:

How to choose the raw material, is key for the service life of the sealing elements. Possessing a considerable level of R & D technology refine mixing is necessary. Rubber products are a polymer chemical technology application, the polymerization of molecules determines the function and endurance of the finished product. With the thoughts of selecting high quality raw materials, the UKS technology research group bases on the molecular structure and practicability can be targeted, and continues to innovate and make progress in pursuit of product perfection to meet different customer needs, different use environments, different practical application of different industries. The group has achieved a lot and has gained a good reputation from customers.

Strict management of the production procedure is quality assurance:

For the processing technique of rubber products, different people have different views. At different stages of technological development, different views exist.

However, UKS processing management system, with rigorous scientific attitude, pursuits simple management mode in the substantive stage of production, and has been closely analyzed unforeseen events at each production stage. UKS buys the most suitable high-tech equipment from production units through cooperative production customization and production program, monitors every second production change on sulfur, thus has reached the highest standard of the industry.

Efficient, unobstructed business management:

Make sure the management reflect the customer-oriented principle, constantly strengthen the successful business management model, enable the team to charm play the due efficiency and effectiveness, the transformation from efficiency to targeted management, will not be difficult to achieve the goals, JANNE VICOSE company, in terms of business confidence, development strategy, sales management and customer service, will continue to pursue excellency.

1. Set up customer complaints and dissatisfaction evaluation line;

2. Set up special lines for product quality problems and technical consultation;

3. Set up logistics process inquiry line;

4. Set up the emergency resolution function team.

Highly intensive, 5S movement:

The market operation combined with franchise mode and sales diversification will continue to mature and improve under the guidance of development strategy. Customer orders and customer suggestions and other information are processed on the same day, special circumstances wouldn't be delayed until the next day, effectively managed in

Works perfectly under targeted programs.

1. Same-day order, same-day processing;

2. Special events, specific person to deal with the perfect solution;

3. Information exchange must be mutual and efficient interaction;

4. Make a decision.

Logistics:

In the process of customer order to the delivery of computer barcode tracking, tallying to achieve barcode automatic scanning, delivery to achieve provincial automatic separation system, packaging to achieve electronic mechanization, efficient mechanization perfectly applied to the daily logistics process.

1. The order will be processed within 8 hours;

2. Improve the level of inventory management, so that the computer technology is fully applied to the inventory upper and lower limit warning system;

3. Tracking goods without gap in the logistics process;

4. The arrival of the goods is the end of the sales, and the technical tracking has reached no time limit and no end;

5. Use of e-commerce with full coverage.

Let time prove that choosing our products and services is the right decision.

The work of all UKS employees will make you clearly feel that time and wealth are at your fingertips.

We firmly believe that UKS's reputation is not the accumulation of numbers, but the word of mouth from numerous global customers.

We prove that dealer is authorized by UKS to sale the series industrial sealing products, and the products we sell are all the certified and quality produces Only the world be developed you will see the appearance about the UKS their are diligent and work with concentration. To reach such this target of perfect UKS never stoped to hard work We believe

- the industry will be developed forever
- product quality and customer service are same of
- no Terminal point

We prove that dealer is authorized by UKS to sale the series industrial sealing products, and the products we sell are all the certified and quality produces
